

PACIFIC NORTHWEST (ZONES 7-9)

The coastal regions of the Pacific Northwest vary in when spring comes based on both their latitude and their elevation; it makes it hard to account for everything when you are choosing plants for your garden. Only by knowing your exact USDA hardiness zone can you know when it is safe to plant your spring garden, as the last frost dates can be anywhere from early February to late April depending on your location. So in spring it is good to have a selection of plants that don't require too much heat and can tolerate your wet weather from winter through spring, however most garden experts agree you are lucky to live in one of the best gardening locations in the world! Look for plants resistant to powdery mildew, which is often a problem in your PNW garden. Here is a short list of some of our favorites for your area!

ANNUALS
